

AZURE EVERYWHERE

Just as every business is different, everyone's journey to the cloud is as well. Maybe you haven't started yet, or you have played around with some workloads, but haven't really seen what all the fuss is about. Of course, it is also possible that your developers have gone out and deployed a critical line of business or customer facing application without your knowledge.

If you're in one of these early cloud stages, Arraya can help by putting some structure around your cloud journey and getting your first IT managed workload out in the cloud.

Best of all, this education and planning could be a free engagement.

Core Azure Workshops

Azure is a massive cloud service with a lot of places to start. Arraya focuses on some core Azure technologies to deliver value quickly through a Fast Start program called Azure Everywhere. These Fast Start engagements are typically 2 days on-site and are designed to educate. At the end, you will have a high level plan to get you started in Azure.

AZURE IAAS FOUNDATION — In this session, we'll focus on the best practices to build a solid foundation in Azure by de-mystifying networking, storage, and virtual machines.

IDENTITY — Most people have an Active Directory domain, but with so many cloud based services like Salesforce, Workday, and Office 365 becoming more prevalent, identities are now front and center in the struggle to maintain control. This session will review Azure Active Directory and talk about how you can leverage it to take that next step to the cloud.

MANAGEMENT & SECURITY — You may already have an Azure tenant, but it might be out of your control. In this session, we will review the management and monitoring capabilities for both on-premises and cloud based workloads. We can also show how using Azure Backups and Site Recovery can provide some quick and immediate value.
